

Standards and Tools in Neuroscience

A summary of the Open Source Brain workshop,
September 2019

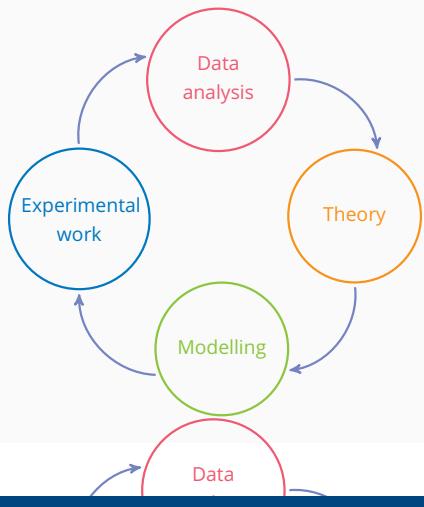

Ankur Sinha
Ph.D. candidate: UH Biocomputation Group, UK,
Volunteer: Fedora Project.

1/8

Notes

The problem statement

Neuroscience is complex, and massive

2/8

Free/Open Neuroscience

Free/Open science:
Scientific material should be easily, openly **accessible to all**.

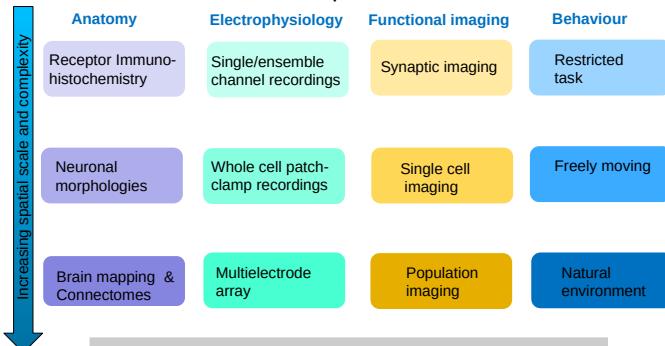

3/8

Notes

Notes

Notes

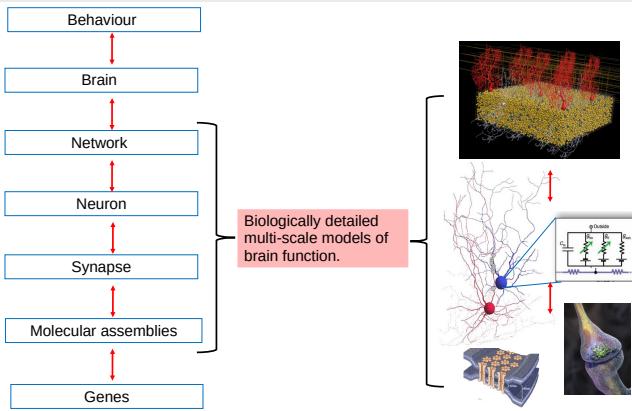

Experimental neuroscience data is heterogeneous, multiscale and analysis is complex

How can we structure neuroscience data to facilitate reuse?

Notes

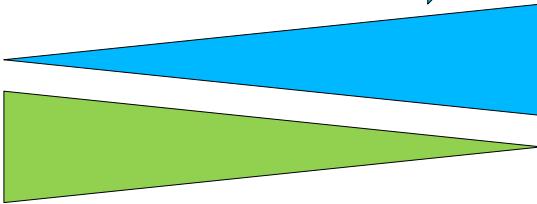

Models of brain function span multiple spatial scales

Notes

A scaling problem

Model complexity →

NWB:N 2.0: An Ecosystem for Neurophysiology Data Standardization

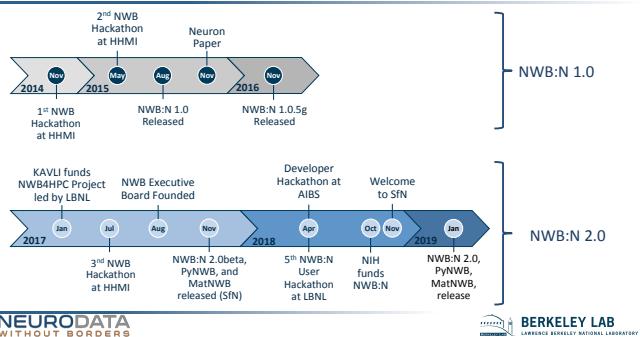

Oliver Rübel

Computational Research Division, Lawrence Berkeley National Laboratory

Open Source Brain Workshop
Alghero, Sardinia
September 10, 2019

A brief history of NWB:N

Notes

Notes

Overview

Motivation: Lack of standards for neurophysiology data and related metadata is the single greatest impediment to fully extracting return-on-investment from neurophysiology experiments, impeding interchange and reuse of data and reproduction of derived conclusions

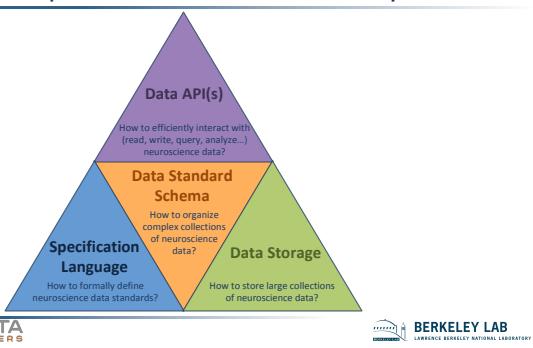

NWB:N – An Ecosystem for Neuroscience Data Standardization

- The NWB:N data standard defines a unified data format for neurophysiology data, focused on the dynamics of groups of neurons measured under a large range of experimental conditions
- NWB:N is more than just a file format but it defines an ecosystem of tools, methods, and standards for storing, sharing, and analyzing complex neurophysiology data

Goal: With NWB:N we aim to develop a next generation data format and software ecosystem that will enable standardization, sharing, and reuse of neurophysiology data and analyses, enhancing discovery and reproducibility

Main components of the NWB:N ecosystem

Converting NMODL to NeuroML

The Simple™, OSB sponsored way of converting models to NeuroML2

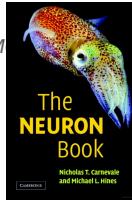

mailto:p.gleeson@ucl.ac.uk

The NEURON simulator

Defining models in *NEURON*

<https://www.neuron.yale.edu/neuron/>

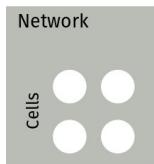

- Cells, Networks: *hoc* language (accessible from Python)
 - morphologies
 - synaptic connections
 - *.hoc* files
- Ion Channels (membrane mechanisms): *NM*
 - *.mod* files

What is NeuroML, and why should I care?

Why can OSB process any NeuroML2 file?

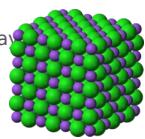

- NML is *structured* (not unlike a *Type System*)

It is all about **Structure**

Structure in NeuroML / NMODL

- A *Type System* (composability rules) is what grants NML its superpowers
- nmodl is also powerful, but can be used as a general purpose language
 - VERBATIM blocks
 - many different ways of achieving same goal
 - prone to *unstructuredness*
- OSB could in theory treat nmodl the same way NML...
 - if only people stuck to "good practices"!

Levels of Abstraction

NeuroML2

```
<ionChannelHH id="kChan" conductance="10pS" species="K">
    <gateHrates id="n" instances="4">
        <forwardRate type="HHExpLinearRate" rate="0.1per_ms" midpoint="-55mV" scale="10mV"/>
        <reverseRate type="HHExpRate" rate="0.125per_ms" midpoint="-65mV" scale="-80mV"/>
    </gateHrates>
</ionChannelHH>
```

NMODL

```
BREAKPOINT {
    SOLVE states METHOD cnexp
    gK = gKbar * n ^ 4
    iK = gK * (v - EK)
}
INITIAL{
    n = alpha(v) / (alpha(v) + beta(v))
}
DERIVATIVE states{
    n' = (1 - n) * alpha(v) - n * beta(v)
}
```

```
FUNCTION alpha(Vm(mV))/ms{
    LOCAL x
    UNITSOFF
    x = (Vm + 55) / 10
    if(x <= 0) alpha=0.1*x/(1-exp(-x))
    else alpha=0.1/(1-0.5*x)
}
UNITSON
```

Notes

Levels of Abstraction

Declarative vs Imperative

- NeuroML2 operates (at least syntactically) closer to the level of abstraction employed by electrophysiologists
- The gory details exist, but elsewhere: *LEMS*
 - i.e. what to do with α , β ; the definition of an *ExpRate*; how all of that is converted to conductances/currents...
- But we seldom need (want!) to interact with that level
(look under the hood)

```
<Network ...>
    <Cell ...>
        <Channel ...>
            <Gate ...>
                <Rate ...>
```

```
SOLVE{...} METHOD euler
...
DERIVATIVE {...}
...
FUNCTION trap(v){...}
```

Notes

Levels of Abstraction

Test Packages

The overall test suite has been divided into a number of components, some containing validation tests specific to particular brain regions, others more generic. All validation tests are written in Python, using the SciUnit framework. Some of these are listed below:

Test suites for specific brain regions

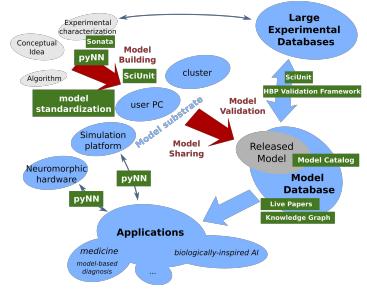

- ❑ **HippoUnit:** <https://github.com/KaliLab/hippounit>
- ❑ **HippoNetworkUnit:** <https://github.com/pedroernesto/HippoNetworkUnit>
- ❑ **CerebUnit:** <https://github.com/lungsi/cerebellum-unit>
- ❑ **BasalUnit:** <https://github.com/appukuttan-shailesh/basalunit>

Test suites for model features, independent of cell type or brain region

- ❑ **MorphoUnit:** <https://github.com/appukuttan-shailesh/morphounit>
- ❑ **NetworkUnit:** https://github.com/mvonpapen/simrest_validation
- ❑ **eFELUnit:** <https://github.com/appukuttan-shailesh/eFELunit>
